EQS. 1–3

Extended and normalized expression · Level 1

$$MP = (MI \times NP) \times SW \times MS^{\gamma} \times CP^{\alpha}$$

$$MP_{norm} = [(MI \times NP) \times SW \times MS^{\gamma} \times CP^{\alpha}]^{1/n_{eff}}, \quad n_{eff} = 3 + \gamma + \alpha$$

SW Strategic Will

Multiplier of the whole system, not only of naval power.

MS^{γ} Maritime Security

Condition of the strategic environment; γ is its weight.

CP^{α} Cyber Power

Structural variable; α is the weight of cyber dependence, not a measure of capability.

ω_k Normalized weights

$\omega_{MI} = \omega_{NP} = \omega_{SW} = 1/n_{eff}$, $\omega_{MS} = \gamma/n_{eff}$, $\omega_{CP} = \alpha/n_{eff}$; they add up to one.

Note: weighted geometric mean (UNDP, 2010; OECD–JRC, 2008). The output lies in (0, 1]; a deficit in one component can be offset only partially, and less so the lower the component, while the collapse of any component cannot be offset at all (limited substitutability).
