EQ. 7 **Maritime Security** · condition of the environment

$$\mathrm{MS} = (\mathrm{IC}^{a_1} \cdot \mathrm{TE}^{a_2} \cdot \mathrm{BC}^{a_3})^{1/\Sigma a}, \qquad \mathrm{MS} \in (0,\, 1]$$

IC — Interstate conflicts

Border, territorial, and maritime resource disputes; gray-zone coercion below the threshold of armed conflict.

TE — Terrorism and extremism

Attacks against vessels, platforms, and port facilities; the sea as a logistical corridor for terrorist financing.

BC — Blue crime

Piracy and armed robbery, transoceanic criminal flows, and environmental crimes such as IUU fishing and pollution.

Note: MS measures the incidence of threats — including their cyber vectors — never capabilities, which are measured only in NP and CP. The threat dimensions follow Bueger and Edmunds (2024); the global weight γ calibrates the environment in the general formula.
