EQ. 4 Maritime Interests · the purpose of maritime power

$$MI = \Sigma_{i=1}^{n} w_i \cdot MI_i, \quad \Sigma w_i = 1, \quad MI \in (0, 1]$$

MI_i Interest i

The i-th maritime interest of the state on a normalized scale (0, 1]: resources, trade, communications, security, projection of influence.

w_i Weight

Relative weight according to national strategic priority, calibratable by state and period. Colombia: n = 18 interests recognized by the Colombian Ocean Commission.

Note: weighted linear aggregation. Within MI the interests are treated as substitutable, so the weights act as rates of substitution between interests rather than as measures of their importance (OECD–JRC, 2008; Greco et al., 2019; Becker et al., 2017).
